Architecture

The container runs the Next.js App Router dev server. Layout renders a static index page. Toolchain config types, lints, and tests the sources but is not a runtime entry point; backend linkage is unevidenced.

Page render flow

The only observed user flow: layout imports the global stylesheet, exports metadata, and wraps the static Home markup. Layout is the response boundary; no search interaction or data loading is wired on this route.

Toolchain boundary

Vitest with jsdom renders Home against Testing Library assertions; ESLint and tsc gate sources. These dev-time tools sit outside the runtime entry point, so passing checks does not evidence any backend wiring.
