How a question becomes a cited answer

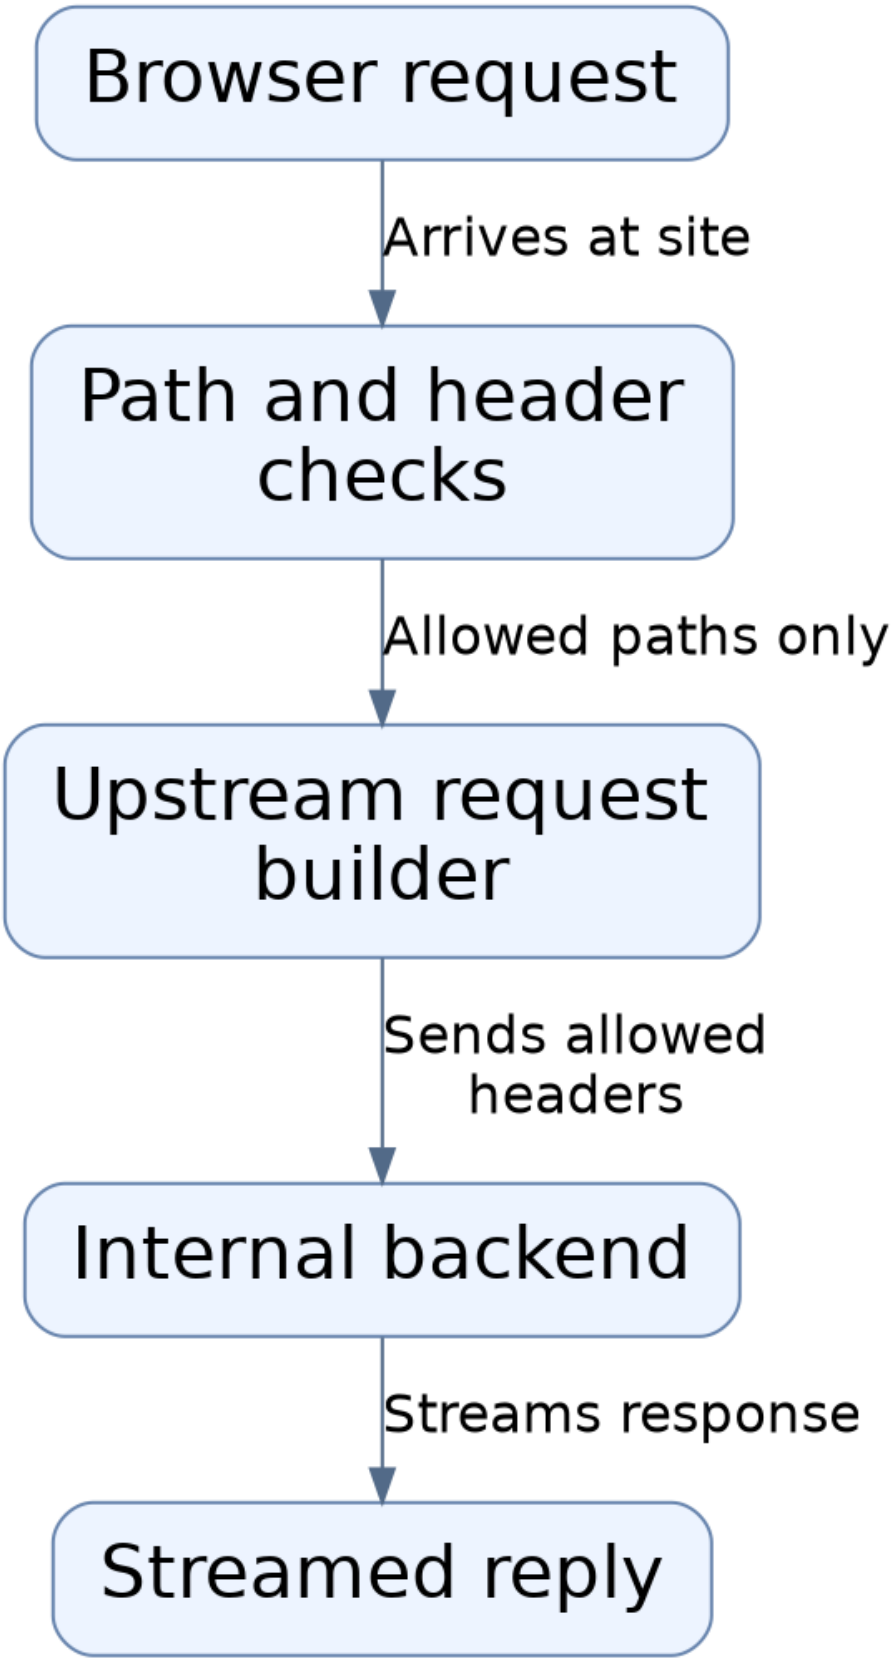

A person picks a collection and identity, asks a question, and watches the answer stream back live. Citations can be opened to view and download the original source document.

How requests are filtered and forwarded

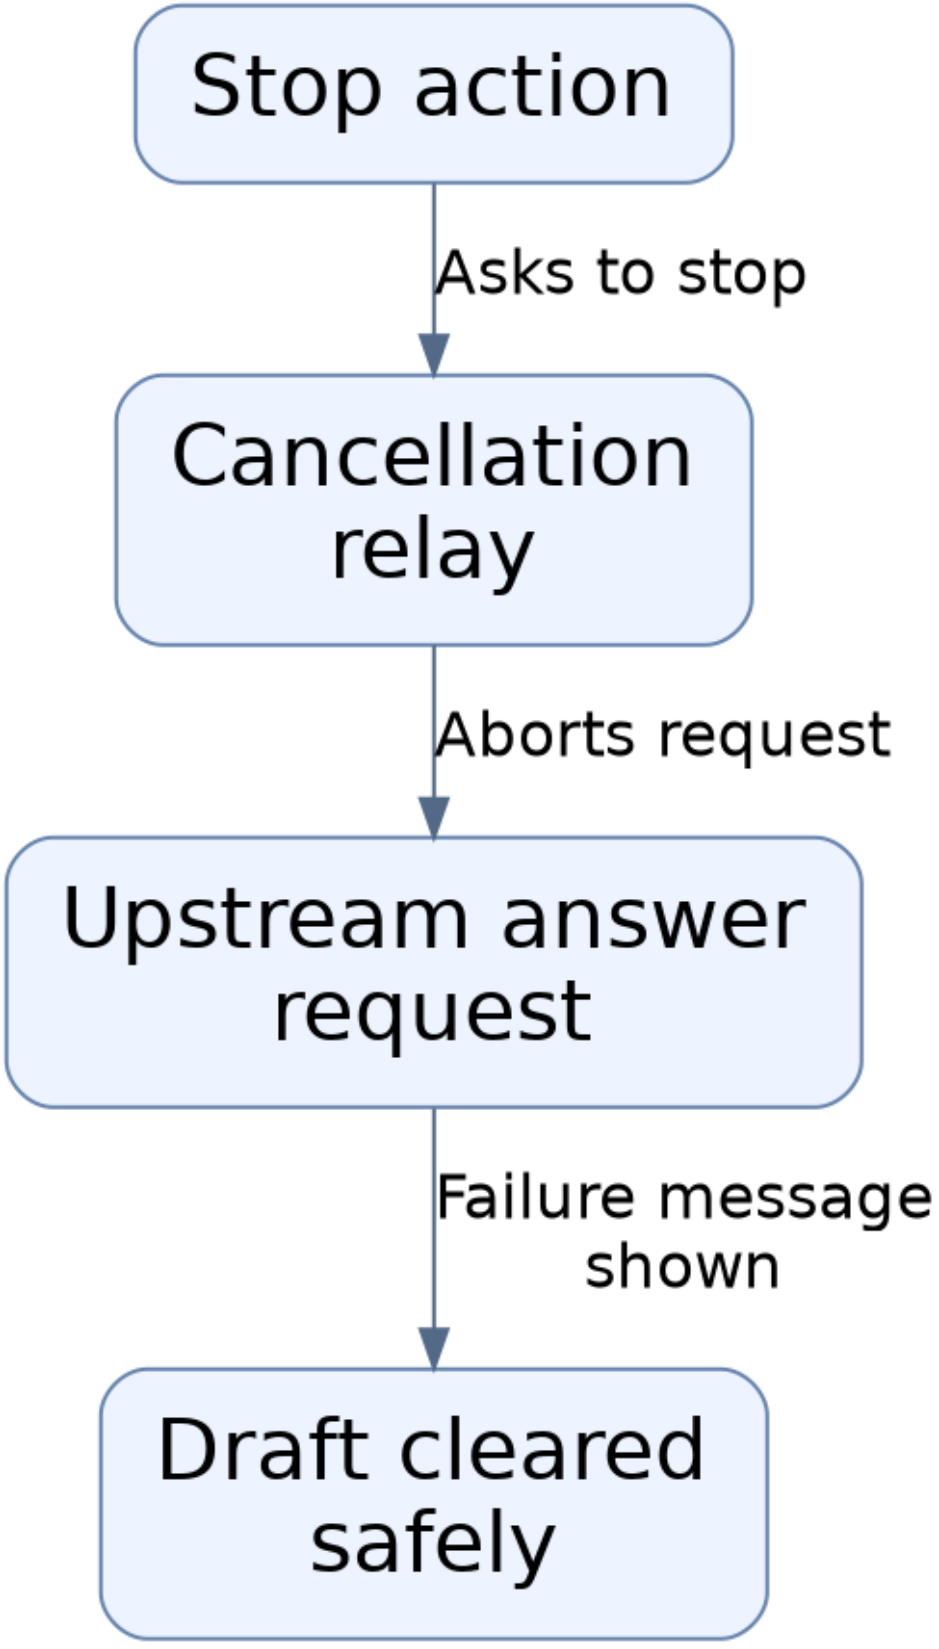

A browser request reaches the site forwarder, which rejects anything outside the allowed path shape, strips sensitive headers, and forwards the rest to the internal backend while streaming the reply back.

Stopping or losing a connection

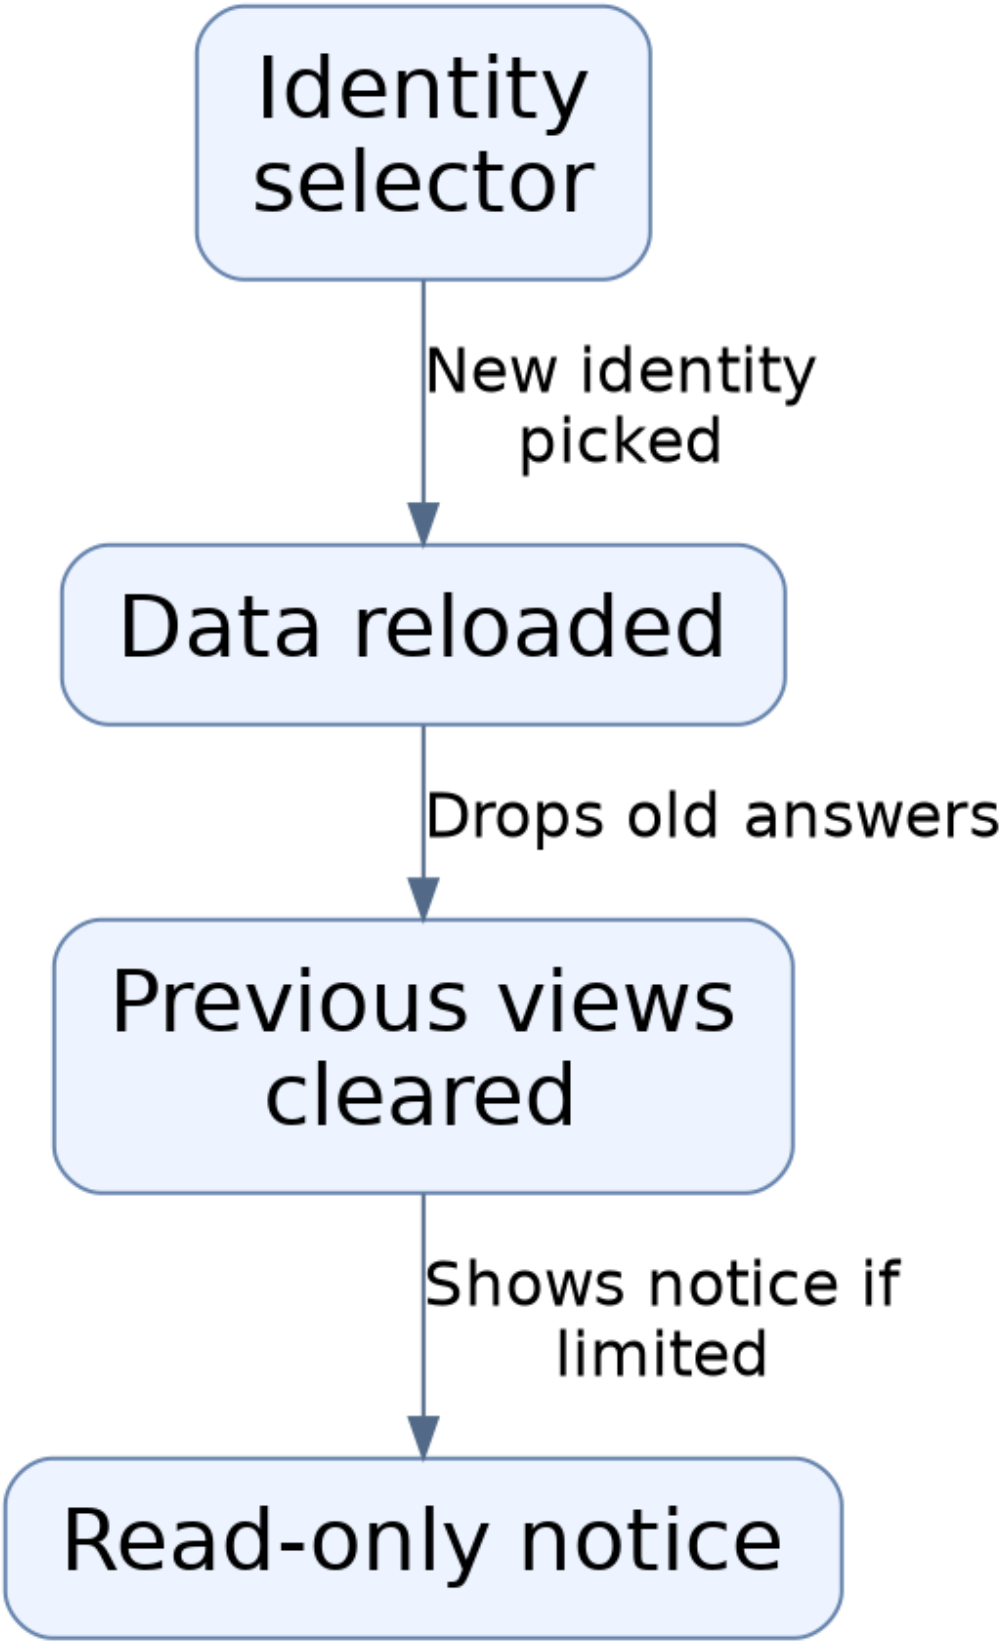

If a person stops an answer or the connection drops, the site cancels the upstream request, clears the partial draft and citations, and shows a safe message rather than an invented answer.

How a person switches identity

Changing the simulated demo identity reloads workspace, collection, and capability choices, clears saved answers, open sources, and manager controls, and shows a read-only notice for view-only identities.
