Architecture

FastAPI app, config, database base, and migration chain form the backend foundation; multiple entry points and tooling invoke them.

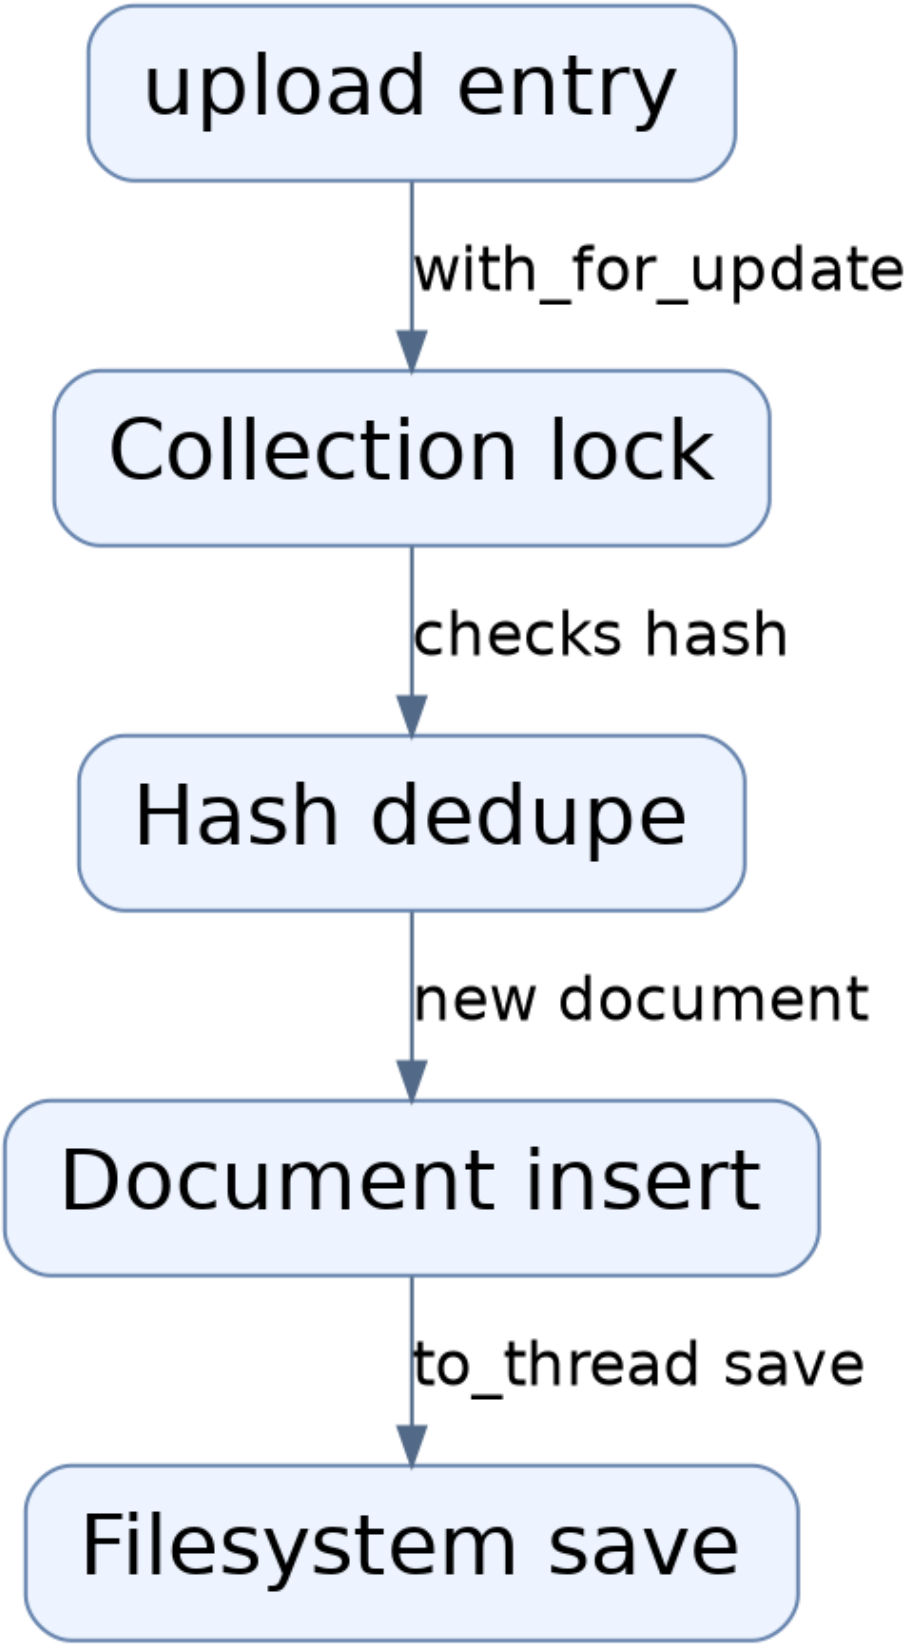

Health and readiness flow

Readiness probes three dependencies concurrently and returns 503 when any check fails; liveness shares one handler.

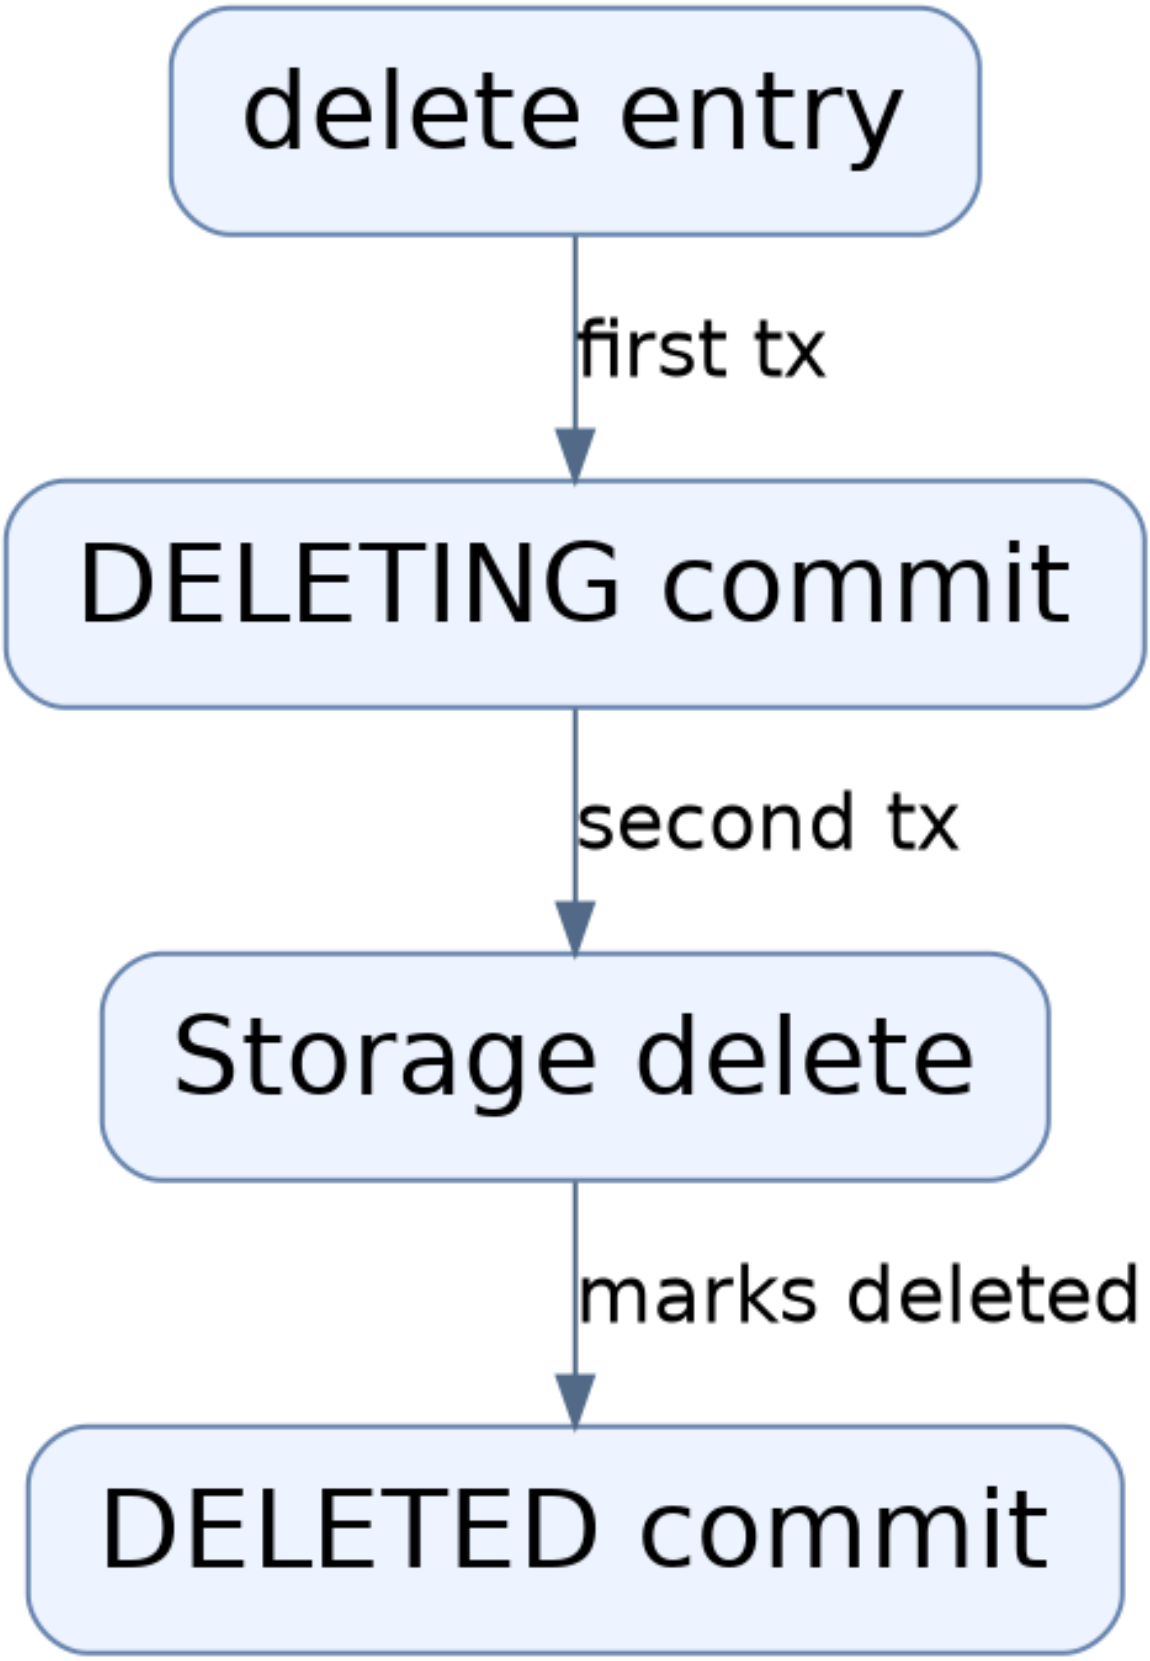

Document upload flow

Upload hashes bytes, locks the collection row, dedupes on content hash, and writes storage off the event loop.

Document delete flow

Deletion uses two transactions: durable DELETING intent, then storage removal with DELETED status.

Schema evolution

Linear Alembic revisions build identity, content, retrieval, evaluation/audit, then incremental ingestion-job columns with triggers.
